Research Interests

My core research interests are in Computational Affective Cognition: building computational models of how humans reason about emotions. At a basic level, I distill insights from affective science and cognitive psychology into formal and precise models of reasoning about emotions. At a more applied level, I apply these models to study mental disorders (computational psychiatry) and to improve computational agents (affective computing/robotics).

In my work, I take an interdisciplinary approach grounded in cognitive science and affective science, along with tools from computer science (machine learning; natural language processing) and behavioral economics (economic games and analyses).
